

**Physics 108**  
**Second Midterm Examination**  
Friday 11 March 2005

TIME: 50 MINUTES

FULL NAME: \_\_\_\_\_ STUDENT # : \_\_\_\_\_

SIGNATURE: \_\_\_\_\_

This Examination paper consists of 9 pages (including this one). Make sure you have all 9.

INSTRUCTIONS:

Write your name on every sheet.

Calculator and 1-page Summary Sheet allowed.

Try every question — easy ones first! A *diagram* is usually a good start.

*Read carefully!*

Your answers may be expressed in terms of irrational numbers like  $\pi$  or  $\sqrt{2}$ .

MARKING:

<b>Q1</b>	/50
<b>Q2</b>	/50
<b>TOTAL</b>	/100

---

NAME OF INSTRUCTOR:      Jess H. Brewer

**Q1 QUICKIES** [10 marks each — 50 total]

(a) Show with sketches how to combine

*i*) two identical capacitors to give an equivalent capacitance half as big as either;

*ii*) two identical resistors to give an equivalent resistance half as big as either;

*iii*) two identical coils to give an equivalent inductance half as big as either;

*iv*) two identical batteries to give an equivalent voltage half as big as either.

(b) Explain why a static magnetic field can't change the kinetic energy of a charged particle.

YOUR FULL NAME:

Describe in *quantitative* detail what happens after the switch is closed at  $t = 0$  in each of the following circuits, where  $C = 0.1 \text{ F}$ ,  $R = 10 \Omega$ ,  $L = 0.01 \text{ H}$  and  $\mathcal{E} = 10 \text{ V}$ .  
 (Graphs are fine as long as the axes are labeled *quantitatively*.)

- (c) The capacitor is initially charged to  $Q = 1 \text{ C}$ .

- (d)

YOUR FULL NAME:

- (e) A loop of limp braided wire lies flat on a frictionless table in an elongated oval shape. Suddenly a uniform magnetic field is turned on normal to the table's surface. What happens to the loop? Why?

YOUR FULL NAME:

**Q2 Ideal Coaxial Cable [50 marks]**

An idealized coaxial cable consists of a solid cylindrical wire of length  $\ell$  and radius  $a$  coated with a thin layer of insulating paint and a second thin layer of metal (outside the paint, so that it does not make electrical contact with the inner wire). The thickness of the paint and that of the outer conductor are both negligible compared with  $a$ , and we shall treat the wire as “long” ( $\ell \gg a$ ) so that “end effects” can be neglected.

A net current  $I_0$  flows down the solid central conductor and back (in the opposite direction) along the thin outer conductor. The current density  $\vec{J}$  is uniform over the cross-sectional area of the central conductor and the returning current is uniformly distributed over the surface of the outer conducting shell.

(a) [10 marks] In what *direction* is the vector magnetic field  $\vec{B}$  inside and outside the cable? (Indicate on the sketch and/or in words.)

(b) [10 marks] Calculate the magnetic field strength  $B$  as a function of  $r$  (the distance from the central axis),  $I_0$ ,  $a$  and any fundamental constants, both inside and outside the cable.

YOUR FULL NAME:

- (c) [10 marks] Calculate the cable's *inductance* in terms of  $a$  and  $\ell$ .

- (d) [10 marks] Describe what would happen in the cable if the battery driving the current were suddenly “shorted out” by a superconducting switch.

YOUR FULL NAME:

- (e) [5 marks] Now assume that the thin outer conductor has *no* resistance but the solid inner conductor has a resistivity  $\rho = 10^{-6} \Omega\text{m}$ . If  $a = 1 \text{ mm}$  and  $\ell = 2 \text{ m}$ , what is the *resistance* of the cable?

- (f) [5 marks] If  $I_0 = 0.5 \text{ A}$ , what is the *electric field*  $\vec{E}$  in the inner conductor?

YOUR FULL NAME:

(extra work space)

YOUR FULL NAME:

**Constants and Conversion Factors.** (You may not need all of these!)

<i>Exchange Rate</i> (10 Mar 2005)	\$1.00 USD = \$1.20412 CAD
<i>Universal Gravitational Constant</i>	$G = 6.672 \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{ s}^{-2}$
<i>Mass of the Earth</i>	$M_E = 5.974 \times 10^{24} \text{ kg}$
<i>Mean radius of the Earth</i>	$R_E = 6367 \text{ km}$
<i>Planck's constant</i>	$h = 6.6262 \times 10^{-34} \text{ J}\cdot\text{s}$
<i>Permittivity of free space</i>	$\epsilon_0 = 0.8854 \times 10^{-11} \text{ C}^2/\text{N}\cdot\text{m}^2$ [or F/m]
<i>constant in Coulomb's Law</i>	$k_E = \frac{1}{4\pi\epsilon_0} = 8.988 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$
<i>Permeability of free space</i>	$\mu_0 = 1.2566 \times 10^{-6} \text{ N}/\text{A}^2$ [or H/m]
<i>constant in Biot-Savart Law</i>	$k_M = \frac{\mu_0}{4\pi} = 10^{-7} \text{ T}\cdot\text{m}/\text{A}$
<i>Electric charge of a proton</i>	$e = 1.602 \times 10^{-19} \text{ C}$
<i>Speed of light in vacuum</i>	$c = 2.99792458 \times 10^8 \text{ m}/\text{s}$
<i>Avogadro's number</i>	$N_0 = 6.022 \times 10^{23} \text{ molecules per mole}$
<i>Proton rest mass</i>	$M_p = 1.673 \times 10^{-27} \text{ kg}$
<i>Neutron rest mass</i>	$M_n = 1.675 \times 10^{-27} \text{ kg}$
<i>Electron rest mass</i>	$m_e = 9.11 \times 10^{-31} \text{ kg}$
<i>Boltzmann constant</i>	$k_B = 1.3807 \times 10^{-23} \text{ J}/\text{K}$
<i>electron volt</i>	$1 \text{ eV} = 1.602 \times 10^{-19} \text{ J} = k_B \times 11,600 \text{ K}$
<i>Atmospheric pressure:</i>	$1 \text{ atm} = 760 \text{ torr} = 1.013 \times 10^5 \text{ pascal} [\text{N}/\text{m}^2]$
